

The Digitalisation of Extension;

making sense of open-knowledge for sustainable agriculture in the era of digital advisory platforms

What do these platforms do?

Who designs them and how?

What are the implications for farmers and their work?

What I found

1. How technologies afford a certain vision of sustainability
2. How new voices in extension shift how sustainability is organised and enacted
3. How farmers respond to these new innovations and how we might design better, more effective tools

So what

1. Opening-up design and knowledge production to include both farmers and ecologies as stakeholders
2. How future organisations might achieve lasting sustainability
