

Diagnosing Disease with Shopping Data

Elizabeth Dolan, PhD Candidate, *Horizon Digital Economy Research*

elizabeth.dolan@nottingham.ac.uk

Supervisory team:

- James Goulding, NLAB
- Laila Tata, Epidemiology
- Alexandra Lang, Human Factors

The aim of my PhD is to create a framework for using shopping data in medical research by investigating the issues surrounding the use of an individual's personal transactional data in public health research projects.

Research Question

How can personal transactional data be collected and analysed for the purposes of health research in (1) a way that is acceptable to society, and (2) works for infectious and chronic disease?

METHODOLOGY

Mixed methods collecting and analysing both qualitative data, and quantitative data for integrated interpretation:

CHRONIC DISEASE: Ovarian and bowel cancer

INFECTIOUS DISEASE: Respiratory deaths and COVID-19

Study 1: Public acceptability

- Study – Interviews with the general public on sharing loyalty card data for health research into ovarian / bowel cancer and covid-19.

Study 2: Domain knowledge, and Patient and Public Involvement

- Study 2 – Survey on ovarian cancer diagnosis and shopping habits to assess potential of loyalty card data in health research using Machine Learning

Study 3: Nationwide longitudinal shopping data to investigate Public Health

- Study 3 – Machine learning analysis of national transactional data to investigate respiratory deaths and COVID 19 in the UK population.

Mixed methods to create:
A framework for using shopping data in
medical research

- Study 4 – Collection, and analysis of individual loyalty card data linked with participant health data to investigate:

a) ovarian cancer

b) COVID 19.

Avon Longitudinal Study of Parents and Children

The
Alan Turing
Institute

The PhD is connected to a wider project by partners: ALSPAC, Bristol University
www.bristol.ac.uk/alspac/ and the Alan Turing Institute

METHODOLOGY

Mixed methods collecting and analysing both qualitative data, and quantitative data for integrated interpretation:

CHRONIC DISEASE: Ovarian and bowel cancer

INFECTIOUS DISEASE: Respiratory deaths and COVID-19

Study 1: Public acceptability

- Study – Interviews with the general public on sharing loyalty card data for health research into ovarian / bowel cancer and covid-19.

Study 2: Domain knowledge, and Patient and Public Involvement

- Study 2 – Survey on ovarian cancer diagnosis and shopping habits to assess potential of loyalty card data in health research using Machine Learning

Study 3: Nationwide longitudinal shopping data to investigate Public Health

- Study 3 – Machine learning analysis of national transactional data to investigate respiratory deaths and COVID 19 in the UK population.

Mixed methods to create:
A framework for using shopping data in
medical research

- Study 4 – Collection, and analysis of individual loyalty card data linked with participant health data to investigate:

a) ovarian cancer

b) COVID 19.

Digital Footprints Lab

<http://digifootprints.co.uk/research/>

“A multidisciplinary team using digital footprint data to understand people’s behaviour and health, based at the Population Health Sciences, Bristol Medical School, University of Bristol. Currently we are focusing on transaction data, specifically loyalty and banking cards, and working on realising the value of using these data to improve population health.”
